

Military Air Solutions

Electrical & Electronic Engineering

As an Electrical and Electronic (E&E) Engineer within BAE Systems you will be responsible for a vast range of Electronic products and services throughout their entire life cycle, from inception through to disposal. One project may have you working with the latest technology available – creating inspired designs to be sure such innovation is used to its full potential, another may have you working at military bases to ensure existing technology is maintained correctly to guarantee its availability when urgent action is required. Whatever the role, you will work first hand on the products and services that “give real advantage to the men and women of our customers’ armed forces”

All E&E Engineers within BAE Systems are highly motivated, analytical and creative, able to see both small detail and how this affects the whole system. E&E Engineers must be focused on quality, safety and reliability of their work as they are the factors which give the advantage to our products. Effective communication skills are essential here as you will certainly have involvement within multi-disciplinary projects which require you to work with both employees from across the whole spectrum of BAE Systems as well as those of the Armed Forces.
